# Why These Projects Matter

In the real world, data is rarely simple. Many datasets include a mix of numbers, categories, rankings, repeated measurements, and other complex forms of information. This makes analysis more challenging, but also more interesting and impactful.

These projects focus on building practical open-source tools that help people:

- discover meaningful patterns in complex data
- make better data-informed decisions
- improve predictions and insights
- turn advanced analytics ideas into tools that people can actually use

# Why Students Should Get Involved

These projects provide a great opportunity for undergraduate and graduate students to **learn by doing**. You can build valuable skills that are useful for internships, research, graduate school, and future careers.

By joining these projects, students can gain experience in:

- Python programming
- open-source software development
- data analysis and visualization
- statistical and business analytics
- reproducible research
- solving real-world problems with data

You do not need to know everything before getting started. **Curiosity, a willingness to learn, and an interest in working on meaningful projects are what matter most.**

# Contact Information

**Principal Investigator:** Zhaohu (Jonathan) Fan, Ph.D.

**Office:** Scheller College of Business, Room 4144
